Continuation of 11. does NOT place the application in condition for allowance because: the main argued features, i.e., method for discovery of a device in an ad hoc network including discovering a device including a middleware layer for providing services and applications discovery, confirmation if the device includes the middleware layer so as to initiate a message exchange for middleware based application and services information exchange, read upon Nidd in view of Beck as follows.

Nidd teaches a method for service discovery in an ad hoc network (see the pp [1]-[8], [12]-[13], disclosing using SDPs in devices for service discovery of other devices in an ad hoc network). Nidd teaches means for accessing a remote device for obtaining information for the set-up of a connection related to services/applications provided by the remote device before using the discovered services (see pp [23]), thus Nidd discloses a method of discovering for a service/application supporting means in a device before initiating a discovered services/applications with the device. Nidd, however misses teaching a "middleware layer", whose function is to provide services and applications discovery, that Nidd already discloses about the SDP, whose function is providing for service discovery. Beck teaches a method for services discovery in an ad hoc network, where Beck clearly teaches a middleware layer enables a device to discover, advertise and use services, thus it is obvious for one skilled in the art to modify the teachings of Nidd reference by combining the specific teaching of middleware layer in a device for discovering services and applications in an ad hoc network of the Beck reference to improve the system and method discussed by Nidd.

As a result, the argued features were written such that they read upon the cited references.
